Overview

The Ultra High Speed Ground Transportation (UHSGT) Planning Dashboard is a tool to investigate the Eugene, OR to Vancouver, British Columbia corridor for the purposes of planning a potential UGSGT system in the Pacific Northwest (PNW). This dashboard is a web-based application - it requires no specific technical domain knowledge to use and gather information from. This dashboard brings together a variety of data streams which work together to represent the governance and transportation networks which make up the corridor. Combining all of this data in one place allows the user to inspect spatial connections between different features and retrieve statistics with ease and immediacy. In addition, this tool provides the ability for users to define their own spatial geometries and investigate how those new features interact with existing map layers, boundaries, and features.

Dashboard Features

The main features included in this map are as follows:

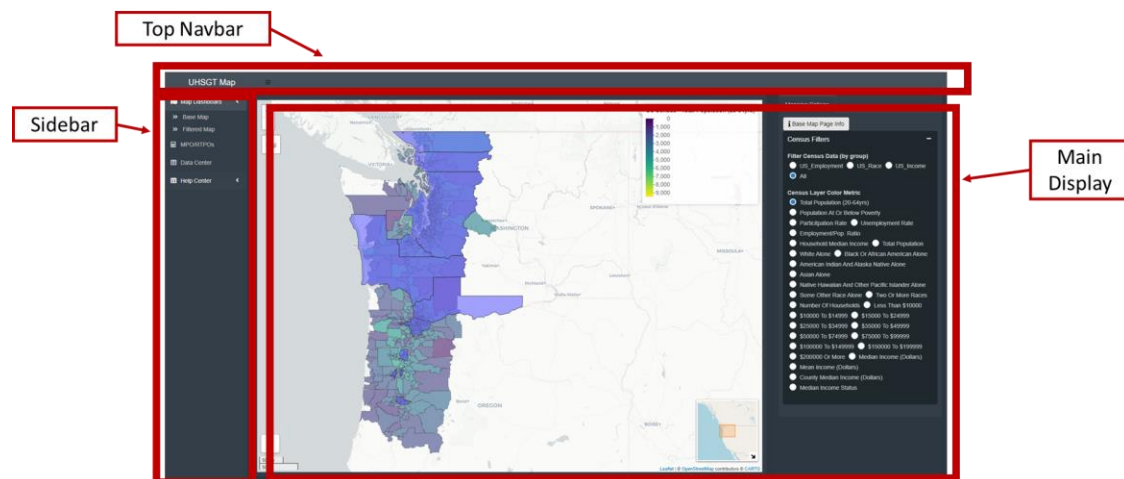

- A large interactive map of the corridor from Eugene, OR. to Vancouver, British Columbia
 - This map contains a number of different layers and displays layer feature meta-data
 - This map encourages the user to explore the corridor at a high level
- The ability for users to provide/create their own geometry and see how it interacts with the default map
 - This feature increases the user's ability to target areas and map layers
 - Users can download these features (.shp format)

User Manual

This document stands to serve as an operation manual on how to use and navigate the dashboard. In addition to this document, the dashboard also contains a number of information buttons that can be clicked on that provide information about a particular page or dashboard functionality.

Dashboard Navigation

The dashboard use-interface (UI) is composed of three sections - the top header bar, the left sidebar, and the main display.

Top Header Bar

- This bar is intentionally bare
- It contains the title of the dashboard and a menu-icon (three stacked bars)
- Clicking on the menu-icon will collapse the left sidebars - resulting in a wider main display

Left Sidebar

- As mentioned above, the sidebar can be collapsed to make more room for the main display
 - The sidebar can still be used to navigate the site when collapsed
- The left sidebar contains the links to different pages on the dashboard
 - **Map Dashboard** is the default page and contains two sub-pages
 - The **Base Map** page displays the base map and map input controls on the right sidebar
 - The **Filtered Map** page contains all of the features that allow for user-defined geometry, map sub-setting, and metric aggregation
 - The **Regional Planning** page contains information pertaining to US MPOs and Canadian Regional Districts (RTDs)
 - In particular, this page details when specific planning documents will be redrafted and published by the MPOs/RTDs
 - The US documents tracked by this dashboard are the Comprehensive Economic Development Strategy (CEDS), Regional Transportation Plan (RTP), and the Transportation Improvement Program (TIP)
 - The Canadian documents traced by this dashboard are equivalent to that of those specified above
 - The **Data Center** page contains tables detailing the layers used for the base map
 - The **Help Center** widget does not link to a new page but displayed additional help and information buttons when clicked

Main Display

- All clickable page links (except “Help Center”) on the left sidebar will take the user to new display page
- The main displays are made of containers that hold/show maps, plots, buttons, or inputs that the user can interact with

Dashboard Pages

This section describes the different pages of the dashboard and their functionality in more detail.

Base Map

This page displays the base corridor map and it's census inputs.

The default map displays a multitude of layers depicting jurisdictional boundaries and important transportation features located along corridor. The extent of the base map reaches from Eugene, Oregon to Vancouver, British Columbia and from the Pacific Ocean to the Cascades. Many of the map layers' extents were much larger than what is currently shown in the dashboard but were buffered/reduced to limit computational load and to

narrow the region for planning efforts. As implied earlier, the map contains layers for British Columbia, Washington, and Oregon - not all states or regions have the same type of data or types of layers available to them. This was a result of data being available for certain regions and not others as well as differences in data between the US and CA.

Map Info

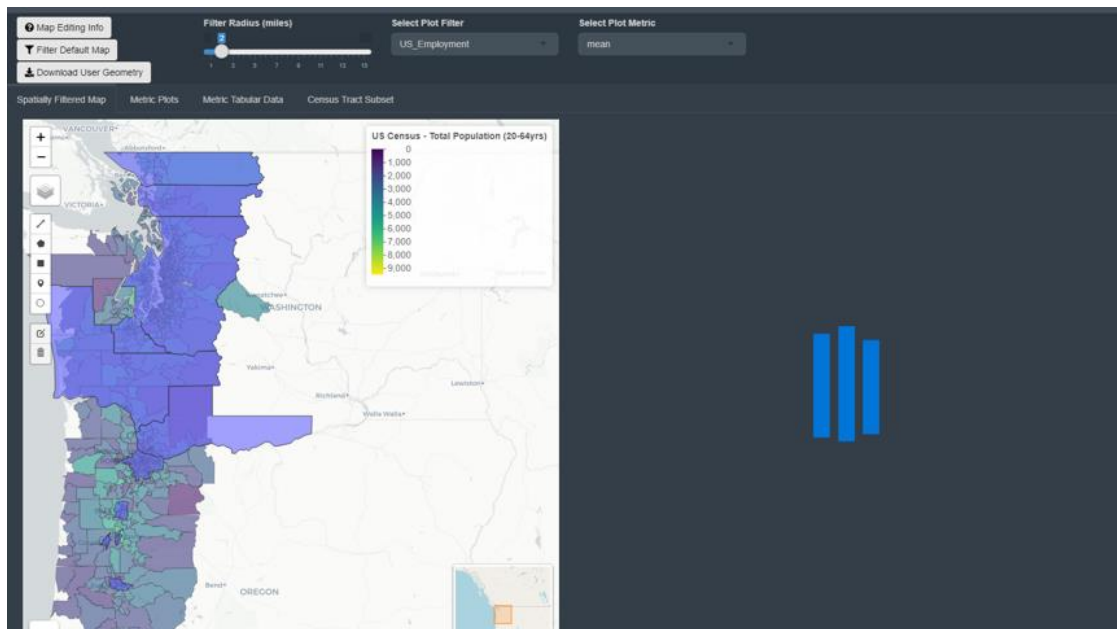

- The map is interactive
 - It can be manipulated using your cursor
 - Perform zoom and pan operations by clicking on the map and rolling the mouse wheel or drag the map, respectively
- Layers can be hidden or displayed by clicking on layers contained in the map layer icon
 - See the upper left-hand corner of the map
 - The default displayed layers are Regional Planning and US/CA Census tracts
 - The US and CA Census layer's name will change depending on what Census metric is being used to color scale census tracts
 - The default metric for the US/CA Census layers are Total Population and Population(2016), respectively
 - The metric used to color US Census tract polygons can be changed by interacting with the Census Filters menu
 - See the sidebar drop-down to the right of the main display
- The number of metrics per US and CA can be reduced
 - Filter Census Data (by group) changes/limits the available Census Layer Color Metric options and which metrics are displayed on the map
- The right sidebar contains inputs the user can use to augment the map
 - The user can limit the number of Census metrics shown in the map pop-up window by
 - The user can change the census layer coloring be changed by interacting with the Census Filters menu
 - The colors used for the US and CA census layers can be changed individually
 - The metric used to color the map will also be displayed in the histogram below each menu input
- The right sidebar displays two plots for the US and Canadian drop downs
 - These plots display histograms for the selected variable used to color each census layer by
 - The top plot displays the histogram for the entire corridor for the specified hairball
 - The bottom plot displays the histogram for a subset of the corridor for the specified variable
 - This subset is determined by the map bounding box created by the map viewer pane
 - Example: if the user zooms into the map, they will make this bounding box smaller this displaying a smaller number of census tracts, the subset

map will redraw the histogram only using the census tracts seen in the viewer pane/bounding box

Filtered Map

This page enables the user to define new geometries to use to spatially filter the default corridor map. The subset returns all layers and features that it overlaps with and removes all layers that it has no interaction with. Metrics for the remaining census tracts are aggregated and returned to the user both visually in a series of plots and in tabular form. The subset aggregates can be compared to the corridor level aggregates to investigate how user defined spatial subset deviates from the corridor as a whole. For example, a user might be interested in equity and a specific demographic's representation for a potential Right-of-Way (ROW). The user draws a line on the map representing the proposed ROW, all relevant layer and map features are returned to the user once they initiate the subset process. They can then investigate their question regarding equity with respect to the proposed ROW. The user-defined features and resulting aggregated data can be downloaded - these processes are described below. The data created via the subset are available for both US and CA layers.

This page is composed of two containers - the top input container and the lower tab box. The top input container houses buttons and inputs that the user can use to define and initiate the map sub-setting and metric aggregation process. The tab box contains a number of tabs that house the sub-setting features and the resulting maps, plots, and tables.

Page Description

- Top Input Container
 - Contains the buttons used to filter map and download shapefile
 - Displays the inputs to change the buffer applied to the user's geometry and selector for variables to show the box plots

- Spatially Filtered Maps
 - This is the default tab for the tab box
 - This tab Displays two maps - the left is editable and the right displays those edits and returns buffered corridor map
 - The buffered map (right map) will not load until the process has been initiated by the user
- Metric Plots
 - This tab displays plotted aggregated metrics based on the geometries defined by the user geometries and the resulting subsetted corridor
 - The top plot displays the Percent Difference between the corridor and corridor subset for all US Census variables
 - The user can choose which metric is displayed resulting from the aggregation process
 - The median, mean, min, max, or standard deviation of the aggregated metrics - mean is the default implying the values are the average of the metrics for the subset census tracts and the corridor census tracts
 - E.g. $100 * (\text{mean}(\text{Subset_Metric}) - \text{mean}(\text{Corridor_Metric})) / \text{mean}(\text{Corridor_Metric})$
 - Green indicates that the subset aggregate is larger than the corridor level aggregate (does not imply “being better” than)
 - Both of these plots are interactive
 - The user can hover-over features with the tool-tip to display more information
 - The user can zoom in on plot features using the zoom controls
 - The user can take pictures of the plots and save them using the camera feature
 - The bottom plot displays the same data but in box-plot form
 - The box plots indicate the central tendency and spread of the US Census metrics over the corridor and subsetted census tracts
 - The user defines which variables to include in the plot by clicking on variables in the table left-adjacent
 - Like above, this plot is also fully interactive
- Metric Tabular Data
 - This tab displays the same information as the above plots do but in tabular form
 - The data in this table can be downloaded using the buttons located on the top of the table
- Census Tract Subset
 - This tab contains a table detailing which census tracts were selected by the subset

- The data in this table can also be downloaded and should be downloaded along with the tabular metrics above

Subset Process Description

- The user defines a new geometry - polygons, lines, points, etc - using the left toolbar on the left hand map (see Spatially Filtered Maps tab)
- The user defines a buffer (default 1 mile) to be applied to their geometry (see top Navbar)
- The user submits their selections and initiates the filtering and aggregation process by clicking the Filter Default Map button (see Navbar above)
- The user defined features and the resulting subset will be displayed on the right hand map (see)
- US Census metrics (corridor and subsets) are displayed on the Subset Plots and Subset Data tabs
- The user has the option to download their geometry by pressing the Download User Geometry button (see Navbar above)

Regional Planning Page

This page contains information about the regional agencies responsible for transposition planning along the corridor. In the US, regional transportation planning is performed by metropolitan planning organizations (MPO) or regional transportation planning organizations (RTPO) - these organizations are federally mandated and federally funded and are in place to ensure regional cooperation with regards to transportation planning. In Canada, the regional planning is performed at the Regional District level - the map currently only contains regional planning documents for Vancouver Metro/TransLink. This layer of governance directs and allocates investments for transportation projects, establish shared vision and goals for the future of the regions, and acts as a conduit that facilitate collaboration between residents, interested parties, and other levels of government both at the federal, state, and local levels. In acting in the capacity stated above, regional transportation planners produce a number of publications which detail both short-range project funding and long-range transportation planning. For the US regional planners, these documents are the Transportation Improvement Program (TIP) and the Regional Transportation Plan (RTP), respectively. The Canadian regional transportation planners also release documents that are similar to and act in the same capacity as the documents stated above - they are currently classified in the dashboard with the TIP, RTP, or CEDS acronyms for simplicity.

This page contains a few features to help track these documents and to provide information on the US and CA regional planning organizations:

Census Metrics Table

- This table is the result of spatially aggregating the census tract layers using the US MPO/RTPO boundaries
 - This table does not currently contain data for Vancouver Metro

Documents Timeline

- This plot graphically depicts when the different US/CA regional planning organization's planning documents are expected to be rewritten or updated
 - The RTP documents are supposed to be updated every four years
 - The TIP documents are supposed to be updated every year
 - The expected document update dates seen in this plot are estimates
 - These estimates are based off of the information above and when the document was published or last updated
 - IT was to determine for some of the documents when they were last updated and some of the information contained in this plot may be incorrect

Data Center

This page allows the user to examine and retrieve the data contained in the base map. This page contains two tables - the left hand table contains information on all the layers which are currently included in the base map and the right hand table details the information contained in each layer. All layers have been previously processed in order to remove superfluous information, clean or reconstruct data of poor quality, spatially buffer to limit the original extent of the data, or two combine similar data that were retrieved from separate sources. Links are provided to the data's original source as well as features that allow the user to download the processed data.

Default Map Data Layers table

- Contains information for all layers in base map
- Contains notes on the data layer - enabled by user click
- Contains links to the original data source - enabled by user click
- Clicking on a singular data layer will select that layer to be displayed in the right-hand table
- The contents of this table can be downloaded or copied by using the buttons at the top of the table

Raw Data for Selected Layer

- Displays the data for the layer selected via user row selection of the left hand table
- Displays all the information for selected layer that is shown in the base map
- The contents of this table can be downloaded or copied by using the buttons at the top of the table

Help Center

Selecting this menu item will not generate a new display window but will two buttons directly below in the sidebar menu. These buttons re-display the into-modal seen when the page first loads and takes you to this document.

Sharing this Dashboard

This dashboard's main intent is to enable UHSGT planners to identify corridor stakeholders early in the planning process. This dashboard was not meant to be a public facing product or made for the use by the general public. Users who have been granted access to this dashboard should ask for permission before sharing this with others. Please contact your WSDOT representative for permission to do so.
